Project Name	Industry-specific intelligent fire management system
Maximum Marks	4 Marks

## Industry-specific intelligent fire management system

Create a code snippet using python to

1. Extract weather data from OpenWeatherMap using APIs
2. Send the extracted data to the cloud
3. Receive data from the cloud and view it in the python compiler

The screenshot shows a web browser window with multiple tabs. The active tab is 'home.openweathermap.org'. The website header includes the OpenWeather logo and navigation links: Weather in your city, Guide, API, Dashboard, Marketplace, Pricing, Maps, Our Initiatives, Partners, Blog, For Business, LALI..., and Support. A green confirmation message states: 'We have sent the confirmation link to lalithkumar.e.2019.ece@ritchennai.edu.in. Please check your email.' Below this is a navigation bar with links: New Products, Services, API keys, Billing plans, Payments, Block logs, My orders, My profile, and Ask a question. The main content area features a banner for 'Historical weather for any location' with a background image of a sunset. The text describes the 'Time Machine' technology and lists features: historical data for ANY coordinate and 40 YEARS of data. It also mentions downloading data from a personal account or contacting them. Two buttons, 'Learn more' and 'Go to purchase', are present. At the bottom, there is a section titled 'Weather Dashboard' with a description: 'The OpenWeather Dashboard is a lightweight and flexible visual tool for our customers who would'.

## Weather in your city

chennai Search

**Chennai, IN** *mist*

**28°C** temperature from 28 to 28 °C, wind 2.57 m/s, clouds 75 %, 1009 hpa

Geo coords [13.0878, 80.2785]

Search engine is very flexible. How it works:

- To make it more precise put the city's name, comma, 2-letter country code (ISO3166). You will get all proper cities in chosen country. The order is important - the first is city name then comma then country. Example - London, GB or New York, US.
